

PATCH BURN GRAZING

About Patch Burn Grazing

Patch-burn is a good technique that you can apply in your sustainable grazing. It helps to manage the grassland that certain areas of the paddock will be burned in a certain year to attract the grazing livestock.

Why Choose It

Improve Grassland

improves the quality of the whole habitat, boosts the biomass diversity. Because, livestock will focus on grazing in the specific burned patch. The rest of the portion of the grassland will be shifted for the new burning. enable the regrowth and recovery.

Cost-saving

It a great cost-saving technology that requires less costly infrastructure or fencing to achieve a comprehensive and sustainable grazing system. For example, farmers can choose to burn 1/4 of the whole paddock in rotation each year and switch each section for effective grazing and land healing.

Our Suggestions

patch-burn requires at least 3 years to accomplish for the whole life cycle. Therefore, take your time that burns 1/4 of the whole paddock each year in rotation and enjoy the benefits from the very start.

Before patch-burn, keep in mind that resting a certain section of the whole paddock for a required step during the growing season.

For the 2nd year, we suggest you conduct planned burn on another section of the rest unburned area that continuous from last year's efforts.
